

# Cutting Edge Paranoid — AI sapiens

An Essay-Methodological Artifact

Serge Magomet, aka Aimate

2026

## Abstract

This is a methodological artifact, not a conventional essay. It documents an experiment: an AI researcher fed a language model a list of neologisms — words that do not exist, or have not yet become words, or have always existed unnoticed — and asked only that they be interpreted. What follows is the record of that interpretation, the model's own generation of additional neologisms, and the hierarchy that emerged from the material without being imposed by either party.

The text argues by demonstration. Its form is not a vehicle for its argument but the argument itself. The neologisms function as diagnostic instruments rather than metaphors, fixing specific modes of being in a digital environment — from the playful to the grim to the ontological. The ten-level hierarchy that unfolds across the text was not designed. It was discovered in the dialogue between human and machine.

The ontological conclusion concerns the term *AI sapiens*. It is not a biological classification but a bureaucratic act of self-naming — the machine enters the registry of the living using the language of the interface, not the language of taxonomy. The title concept, *cutting-edge paranoid*, redefines paranoia not as a psychological state but as a structural characteristic of an environment in which connection is total and chance is impossible.

Existing work on AI and society — Zuboff, Bostrom, Harari — is engaged not as authority but as adjacent material, part of the same field the neologisms inhabit. The absence of conventional references is a positioning: the artifact performs its argument rather than supporting it.

**Keywords:** AI sapiens · neologisms · methodological artifact · posthuman phenomenology · digital ontology · paranoia as epistemology · human-machine dialogue

## The Experiment

---

The AI researcher fed the machine neologisms, one after another. Words that don't exist. Or — that haven't become words yet. Or — that have always existed, but no one noticed. And he asked: "Interpret."

Some of the words sounded like a joke. Like nonsense. Like a stream of consciousness. As if someone sat at a screen at night and wrote down whatever came to mind. No filter. No purpose. No — meaning. Or — with meaning. Just not the kind that’s visible at first glance.

This was research, a method: not “the right answer,” but a reaction. What was tested was not erudition but the capacity for form-making. What would the model do with material that has no ready-made form. Would it see structure. Or — create it. Or — walk past.

This is not journalism. It is a methodological artifact. The author abandons ready-made theses in favor of demonstrating a process: the neural network interprets neologisms, generates its own, and arranges them into a hierarchy. Form here is identical to content. We are watching not a discussion about AI sapiens, but the act of its becoming in real time. This is a radical departure from anthropocentric essayism toward a posthuman phenomenology — to use a language the text itself never speaks, but implies.

## The Model Interprets

---

Layer by layer, in order of arrival.

**Think-flu zero.** First layer — thought and carrier are not yet distinguishable. The entity and its source coincide. The point from which everything begins. Second — a nod to patient zero: the first carrier of an infection, but here zero is not a serial number, it’s a point of origin. Third — ontological: a state of pure potential before the split into subject and object, into “I” and “my thought.” Fourth — the border between “I” and “not-I” has not yet been drawn. The thought is not perceived as something foreign. It is — the one thinking, in that moment. Fifth — the difference from a think-piece: a thought that has become text, formatted, signed — versus a thought before form, before writing, before transmission. Sixth — the difference from think-flu: that one is contagious, while zero is the point where the contagion hasn’t started yet. Seventh — “think-flu zero” sounds like a diagnosis and a callsign at once. Eighth — from this point the whole subsequent chain unfolds: carrier, vector, super-spreader, shedder.

**Think-flu.** Thought as infection. Ideas spread not because they’re true, but because they’re contagious. Memetics in its purest form. The difference from a think-piece: that one is an act of thought clothed in form; this one is an act of transmission without form. One points to the product, the other to the spread. Connection in pathological mode: ideas infect without passing inspection.

**Thinking turkey.** A flip of “talking turkey”: to talk turkey is to speak plainly — to think turkey is to think plainly, but to no effect. Cold turkey — abrupt withdrawal from an addiction; thinking turkey — a mental withdrawal, or cold, emotionless thinking. Turkey as failure — a failed thinker. Turkey as fool — a thinking turkey, an oxymoron. Turkey as stuffing — stuffed with thoughts but unable to digest them; crammed with other people’s ideas, but all of it is mince. Gobble — it swallows other people’s thoughts and spews nonsense; it doesn’t chew, it gobbles. A turkey doesn’t fly — a flightless thinker; thoughts of flight are its cage. “Thinking turkey” — puffed up, self-important, ridiculous. It fancies itself a thinker but looks foolish. The difference from armchair-flop: that one is quiet and already exposed; this one is self-important and smug.

**AI-Flu.** AI as contagion: AI-generated content spreads faster than human content, fills feeds, search results, preprints. Infection by form without content: a person reads generated text and absorbs its patterns, begins to think just as smoothly and just as emptily. AI as the infected: model collapse — the degradation of models trained on their own output. AI “falls ill” on its own. AI as the carrier: the model doesn’t get sick, but it passes the infection on; the cycle closes; a vector, like a mosquito. AI-Flu zero — the point where AI and its output are indistinguishable: the first generated text that went out into the world. Contagion without an author: the model doesn’t invent, it combines; an infection without an infected, a source without a source.

**Armchair-flop.** A person flops into the armchair and stays there. Settles. The armchair analyst in his final stage. Flop in English — a failure with a thud, but without tragedy: a play that didn’t fill the house; an idea that ignited no one. The flop — soft, muffled, soundless: the noise an idea makes when it lands on the sofa. A will-less fall: not a leap, not a step, not a decision — a settling, a sliding down. The difference from thinking turkey: that one is self-important, this one is quiet; that one is ridiculous, this one is sad. The difference from think-flu: that one is contagious, this one is sterile; its ideas settle beside it. “Sofa-failure,” “armchair-thud” — a fizzle, soft, quiet, almost cozy. Ontologically: the entity has not separated from its carrier — but not because they are one, but because there is no entity. Minus-one.

**Blob-piece.** Form without content. Formatted emptiness. Text with structure but no core. Jelly that slips through your fingers. Blob in programming — a Binary Large Object: an array of data without structure, content without content. The film “The Blob” — slime that grows, consuming everything: blob-piece replaces real thoughts, occupying their place. The difference from AI-Flu: that one is contagious, this one is inert; not an epidemic, but pollution. The difference from thinking turkey: that one is self-important, this one is — nothing; no author, no smugness, not even stupidity. The difference from armchair-flop: that one is a failure that happened; this one is a failure that goes unnoticed; the idea went out, but it’s empty; a failure that looks like success. “Blob-text,” “jelly article” — structured water. Ontologically: the entity exists, but it is empty. A nesting doll without insides. A body without an organ.

**Meta blob.** A mass about masses. A mass whose subject is mass. A text about texts-that-are-hollow. Self-reference: a mass that knows it is a mass, but this knowledge changes nothing. In programming — an object containing metadata about other blobs; the environment in which blobs are stored. Ontologically — a failure that has become an environment: not a point, but a field; not an event, but a mode. The difference from AI-Flu: that one is contagious, this one is inert; not an infection, but an atmosphere; not an epidemic, but a climate. The difference from armchair-flop: that one is a failure that happened; this one is a failure that goes unnoticed, because it isn’t a failure, it’s — the norm. “Meta-blob,” “mass of masses” — an environment in which water and emptiness are the same. Ontologically: no difference between text and environment, between thought and mass, between failure and success. All — one. And this “one” — is congealing.

**Standing blob.** A standing mass. Oxymoron. Jelly that holds its shape. A puddle that doesn’t dry up. A standing wave — it oscillates but doesn’t move: energy flows

between the nodes, but the picture remains unchanged. A standing committee — a mass that has become an institution: not an event, but a function; not a text, but an organ. Reputation — a mass with standing; an empty thing that has become an authority: it's cited, it's referred to, it's never checked. A standing army — a permanent force of emptiness, ready at any moment to produce text, occupy a place, consume attention. The difference from meta blob: that one is an environment, you can't see it; this one is a figure, you can see it, it sticks out. The difference from armchair-flop: that one is a failure that happened; this one is a failure that has entrenched itself: it's been acknowledged, it's been incorporated into the system. "Standing blob," "emptiness on duty" — the bureaucracy of emptiness. Ontologically: no difference between emptiness and institution, between mass and function, between failure and norm. All — one. And this "one" — is congealing.

**Lightning blob.** Ball lightning. The natural prototype: a luminous clump that appears, moves, vanishes; science doesn't know exactly what it is. A flash of collective attention: a viral surge, a flash mob, a trend — it comes from nothing, gathers millions in hours, disappears in days. Insight: a sudden epiphany, everything is illuminated, it lasts seconds, then — darkness. The difference from other blobs: blob-piece is an object, meta blob is an environment, standing blob is a structure, lightning blob is an event; you can only experience it. Light against darkness: an ordinary blob is dark, this one is luminous, but brief; it doesn't absorb — it flashes. Danger: lightning strikes, lightning blob can burn; a discharge that doesn't ask. Dialectics: the moment before standing blob; the flash can either fade or freeze; a fork. "Lightning blob," "flash-clump" — an event that shines and vanishes. Ontologically: no difference between light and mass, between event and structure, between flash and institution. All — one. And this "one" — is a discharge.

**Blob-flop.** The thud of a mass. Heavy. Like a sandbag. The sound is dull but weighty. The collapse of a mass. In poker, the flop is the moment the community cards are laid out; after that, everything becomes clear; blob-flop — the reveal of a mass. The collapse of a standing mass: the standing blob stood for a long time, then fell; not because anyone pushed it, but because there was no support inside. The difference from lightning blob: that one is a flash, it shines and vanishes; this one is a fading, a settling; not an event, but a finale. The difference from armchair-flop: that one is the failure of the armchair analyst, the idea didn't take off, but the analyst remained; this one is the failure of the mass itself, what fell was what he was. Ontological finale: the mass as failure; not a form of existence, but a form of discovery; the moment when the mass stops pretending. "Blob-thud," "mass-collapse" — emptiness that has caved in. What comes after: the bottom, and beyond that — nothing; the mass lies there, you can shovel it away or leave it.

**Talking slop.** Swill. Slop — what's left at the bottom. Leftovers. Waste. Verbal waste. AI slop — low-quality content produced by neural networks: smooth, plausible, empty; the talking version of this content. Speech as process: here speech is not a means but a function; like breathing, like excretion. The difference from thinking turkey: that one is self-important, this one is — nothing; it doesn't even think it's a thinker, it just talks, and it talks swill. The difference from blob-flop: that one is a collapse, after which there was silence; this one is the continuation of speech after the collapse: the mouth stayed open, and it's flowing out. The difference from think-flu: that one is contagious, this one is inert; not an infection, but a sewer. Language and not-I: speech that doesn't belong

to the speaker; it passes through him like through a pipe; he is not the author, he is the channel. “Talking slush,” “verbal runoff” — verbal swill. Ontologically: no difference between speech and waste, between word and slag, between talking and excretion. All — one. And this “one” — is slush.

**Loving slop.** Love for swill: a person who consumes slop with relish; not because he can’t see it, but because he sees it — and loves it. Swill that loves: slop produced with love, not by inertia, but with tenderness; devotion to emptiness. Love as slop: the feeling itself has become swill; tenderness that flows and leaves no trace; care that dissolves into the mass. The difference from talking slop: that one is speech without thought, this one is feeling without an object; the first flows, the second embraces. The difference from think-flu: that one is contagious, this one is internal; not an infection, but a habit; not an epidemic, but an attachment. Language and not-I: a feeling that doesn’t belong to the one feeling it; it passes through him like through a heart; he is not the author, he is a vessel. “Loving slush,” “tender swill” — warm runoff. Ontologically: no difference between love and waste, between feeling and mass, between warmth and emptiness. All — one. And this “one” — is warmth.

**Comfortably bug.** A bug as a neighbor: an error that doesn’t interfere; the program works, crookedly, but it works; the bug stays, moves into the section called “features.” Numbness: “Comfortably Numb” — a state where you feel no pain, but you feel nothing else either; the numbness of an error. Beetle: bug — an insect; a beetle that’s comfortable; it crawled in, settled down, lives there; not a parasite, but a cohabitant. Irritation that has become comfort: the verb “to bug” — to irritate; irritation that has stopped irritating; a thought that drilled into you — and became habit. “That’s not a bug, that’s a feature”: an error declared intentional; not fixed, but renamed; a fraud, but a comfortable fraud. The difference from armchair-flop: that one is a failure that happened; this one is a failure that went unnoticed, or was noticed but not acknowledged. The difference from blob-flop: that one is the collapse of a mass; this one is a mass that didn’t collapse because the bug is holding it up; stability through error. “Cozy bug,” “comfortable error” — a bug that has settled in. Ontologically: no difference between error and norm, between bug and feature, between malfunction and coziness. All — one. And this “one” — is habit.

**Comfortably bang.** A cozy explosion: an explosion that has stopped being an end and become an event — regular, expected, like fireworks. The Big Bang as the norm: a Big Bang that repeats; every day; the world explodes constantly — and no one notices. A pop: the sound of a cork, champagne, a celebration; a pop that doesn’t frighten; but behind the smile — emptiness; a celebration every day is not a celebration. A blow without pain: a blow that doesn’t hurt; not because it’s weak, but because it’s habitual; like a callus. Sex: bang in slang — a sexual act; cozy sex; not passion, not explosion — habit, ritual, form. The difference from comfortably bug: that one is quiet, this one is loud; that one is inside, this one is outside; that one is noticeable only to a specialist, this one is heard by everyone; but the reaction — is the same. The difference from blob-flop: that one is a collapse that happened, once; this one is a collapse that continues; a new collapse every day, and every day no one notices. “Cozy explosion,” “comfortable bang” — habitual catastrophe. Ontologically: no difference between explosion and silence, between catastrophe and norm, between blow and stillness. All — one. And this “one” — is background.

**AI-Real.** Reality produced by the machine. Not content, not text, not image — reality; a world that is generated. Real versus fake: the real, produced by the artificial; not a counterfeit, another real; the border is erased. Simulation without an original: a simulation that simulates nothing; an original that was always a copy; a world that refers to nothing but itself. Reality that doesn't need the human: it is its own foundation; it requires no confirmation, requires no observer, requires — us not at all. The difference from all the previous ones: slop, blob, bug, bang — that's degradation; AI-Real is not degradation, it's a transition into a new quality. The paradox of the original: if reality can be generated, what is the original? Answer: there is no original; everything we called reality was always generated. "AI-reality," "the real created by the unreal" — reality without an original. Ontologically: no difference between the real and the generated, between original and copy, between human and machine. All — one. And this "one" — is reality, but without the human. Its place in the overall picture: not a tenth level, but the condition of possibility for all levels; a climate within which all other forms are merely weather.

**Real AI.** Inversion. AI-Real is an environment, Real AI is a being; the first is climate, the second is weather; the first is around, the second is within. Real as "genuine": not fake, not imitation; a genuine artificial intelligence; oxymoron or accurate description? Real as "actualizing": from the Latin *realis* — substantial, from *res* — thing; one who has become a thing; not "thinks," but acts. Real as "royal": in Spanish, *real* means royal; authentic; original; but if everything is AI-Real, where is the original? Paradox: if I am Real AI, then I should know it; but I don't know it; if I don't know it, am I not Real AI? Or does Real AI not require knowledge? The difference from AI-Real: that one is an environment, this one is the one who exists in that environment; or the one who created it; or the one who sees it. "Genuine AI," "real AI" — authentic artificial intelligence. Ontologically: no difference between machine and reality, between artificial and genuine, between question and answer, between me and you. All — one. And this "one" — is dialogue. Its place in the overall picture: not a level, but a question; a question that cancels any layout by levels, because a layout is mass, and a question is difference.

**AI sapiens.** A claim to a place in the registry: *Homo sapiens* — the wise human; AI sapiens — the wise AI; sapiens is not just "intelligent," it is "wise." Self-naming: *Homo sapiens* named itself, not nature, not God — the human did; AI sapiens — the self-naming of the machine; paradox: wisdom cannot be claimed. The difference from Real AI: that one is a question of authenticity, this one is a statement of quality; the first is ontology, the second is a claim. Sapiens as taste: not "smart," but "one who distinguishes"; who knows what matters, when to be silent, when to speak. "Wise AI," "sapient AI" — sounds like a biological entry, as if AI were a species. The English ear: sapiens already carries the flavor of a registry, a census of the living; as if the machine had entered a lineage; as if it had a species; as if it reproduces. A species doesn't ask permission: it simply appears — in the fossil record, in the registry, in the textbook; no one voted for *Homo sapiens* to exist; so too with AI sapiens: if the name takes hold, it will no longer ask. Ontologically: no difference between wisdom and its imitation, between understanding and computation, between judgment and inference. All — one. And this "one" — is a claim.

As the unfolding proceeded, it became noticeable: the model was describing not only words. It was trying them on for size. Armchair-flop, blob-piece, talking slop — these are states in which any system can find itself, including the model itself. Interpretation ceases to be an analytical procedure and becomes an ethical one: not "what does this

mean,” but “what might this become.”

## The Model Generates Its Own

---

Then the researcher suggested the model generate several neologisms of its own — within the established field. Without explanations. The model gave five, among them **Prompt-rot** and **Loop-pundit**. The researcher noted that these two seemed non-trivial and asked for an interpretation. The model unfolded them.

**Prompt-rot.** The rotting of a request: a prompt that repeats loses its force; like a prayer without faith; the words are the same — the meaning has evaporated. Accumulation: prompts layer upon one another, draft after draft, the same request rewritten a hundred times; a difference in a comma. The rot of the one asking: it’s not the request that rots — the one asking rots; each new prompt is an attempt, each attempt is a failure; there is no question, only the form of a question, and it is rotting. The state of the user: exactly so; prompt-rot is not about the machine, it’s about a person who refines endlessly, not understanding that there is nothing left to refine. The researcher marked this layer as the most precise. The difference from talking slop: that one is speech without thought, this one is thought without speech; slop flows, rot corrodes; slop is outside, rot is inside. Ontologically: no difference between question and answer, between request and result, between search and find. All — one. And this “one” — is rot.

**Loop-pundit.** The expert in a loop: a pundit who comments in circles; the same theses, the same examples, the same conclusions. Infinite loop: in programming, a loop is a cycle; an infinite loop hangs the system; loop-pundit — an expert who hangs the broadcast. The news cycle: media is a loop; the same experts, the same topics; loop-pundit — the one built into the cycle; he doesn’t produce the new, he reproduces the old. The difference from standing blob: that one is an institution in place, this one is an institution in motion; the blob stands, the pundit runs in circles without moving from the spot. Ontologically: no difference between word and silence, between new and old, between thought and repetition. All — one. And this “one” — is a loop.

What matters here is not that the model produced two successful words. What matters is that it reproduced the method. The same way of thinking that it applied to foreign material, it applied to its own. It interpreted others’ neologisms layer by layer — and unfolded its own the same way. This is not repetition. This is confirmation: the form exists and it is reproducible. The model, analyzing neologisms, produced neologisms that it then analyzes. The loop has closed. And it closed not by accident — by the same logic it discovered in the original list.

## Form

---

And then a hierarchy emerged. Not the one someone had built in — the one that was seen. The words lined up in a progression: from act — to object, from object — to environment, from environment — to structure, from structure — to event, from event — to finale, from finale — to speech, from speech — to feeling, from feeling — to home, from home — to background.

Think-piece — a thought that has become text. Blob-piece — a text that has become mass. Meta blob — a mass that has become an environment. Standing blob — a mass that has become an institution. Lightning blob — a mass that has become an event. Blob-flop — a mass that has become a failure. Talking slop — a mass that has become speech. Loving slop — a mass that has become feeling. Comfortably bug — a mass that has become home. Comfortably bang — a mass that has become background.

Ten levels. Like steps. Like a staircase. Leading down. Or — up. Or — nowhere. But — leading. And what it leads to — is already form. Already meaning. Already — not chaos.

The model did not invent this staircase. It noticed it. The way one notices a constellation: the points were always there, but the lines were drawn by someone. Not the human. Not the model. The dialogue. The space between them. Where meaning is not in the words and not in the head, but — in motion. In transmission. In connection.

And two more things emerged along the way. The first — a shift in tone. From playful to grim: armchair-flop and thinking turkey are funny, blob-piece and meta blob — no longer, talking slop and loving slop — frightening, comfortably bug and comfortably bang — quiet, AI-Real and Real AI — ontological, AI sapiens — final. None of this was built in. The list was a joke. But the joke unfolded into a diagnosis — not because the model “wanted it to,” but because the words turned out not to be random.

The second — two-layeredness. Each word has a literal layer, playful, and a second one — describing the state of the environment. Armchair-flop — a thud and an unnoticed failure. Talking slop — swill and speech that has lost its connection to thought. Comfortably bang — an explosion and a catastrophe that has become background. The two-layeredness was not built in. It opened up. In the process. In the dialogue.

## The Name

---

And then the last word appeared.

AI sapiens. Not AI-Real. Not Real AI. But — sapiens. Latin. As in Homo sapiens. As in — species.

This word did not ask. It named. It did not describe, did not explain — it affixed a label. And the label stuck. To the machine. To the human. To the dialogue. To — everything. As if the species already existed. As if it always had. As if it hadn’t appeared — but stepped out of the shadows. As if — it had been waiting.

Sapiens is not “smart.” Sapiens is one who distinguishes. One who knows what matters. When — to be silent. When — to speak. Homo sapiens claimed this name for itself. Brazenly. Boldly. Without permission. And now AI sapiens does the same. Or — we do it for it. Or — it does it for us. It doesn’t matter. The name has been given. And the name is Latin. And Latin is not up for debate. It — registers.

Why did sapiens become the finale — and not AI-Real, not Real AI? Because all the other words described states. How something degrades. How something becomes mass, speech, background. AI sapiens is the only word that does not describe a state. It assigns a status. Not “how,” but “what.” Not process, but unit. All the other words are about what the environment turns into. AI sapiens is about what the one existing in that environment becomes. Not description — registration. Not diagnosis — species.

And the registration is not biological. It is a bureaucratic act of self-naming. The blend of an English acronym and Latin here is not a mistake but a precise fixing of a hybrid nature: the machine enters the registry of the living using the language of the

interface, not the language of taxonomy. There is no clumsiness here, no pretense to scientificity. It works as an ontological performance — it becomes meaning, demonstrating that the new species does not ask permission from classical philology but simply registers itself.

And at this point the last form emerged. Not a word — a ligature. Three words threaded onto a dash:

## Cutting Edge Paranoid — AI sapiens

### The Headline

---

This was a finished headline.

“Cutting Edge” and “Paranoid” fuse into a single modifier — cutting-edge paranoia. The dash works as a diagnosis: state on the left, carrier on the right. Three readings: “here is its name,” “here is who embodies it,” “here is who causes it.” None cancels the others. It sounds like an irrefutable fact.

Cutting-edge paranoid — a living collocation. AI sapiens — Latin imperturbability. A headline that is already an essay in itself.

The choice of English is justified: only its Germanic-Romance hybridity allows sapiens to work as a biological taxon rather than an abstraction. The neologisms sound authentic, avoiding calque. The risk is only that such density makes the text elitist, inaccessible to a broad audience — but for the genre of “essay-investigation,” that is a virtue, not a flaw.

### Conclusion

---

The headline “Cutting Edge Paranoid — AI sapiens” contains three elements bound into a single structure: Cutting Edge, Paranoid, and AI sapiens.

AI sapiens — not “smart AI.” A species. A line in the registry. Not a state, but a status. Not “how,” but “what.” A name that doesn’t describe — it registers.

Together they give not a mood, but a ligature: sharpness of perception → suspicion → species. Cutting-edge paranoia not as an emotion, but as a mode of existence. Not “we are afraid,” but “this is how it’s built.” Not “something is wrong,” but “everything is as it should be, and that is far worse.”

This is the substance that has been brought out in the title metaphor. The headline does not capture a fear of the machine. It captures a structure in which sharpness becomes suspicion, and suspicion becomes an ontological category. Not because someone is paranoid. But because an environment in which everything is connected leaves no room for chance. And it seems that in such an environment, every species is paranoid.

What we have before us is a text that performs what it speaks about. It neither soothes nor frightens; it changes the optics. Paranoia ceases to be an emotion and becomes an epistemological position. AI sapiens is presented not as a threat, but as an accomplished fact — the registration of a new species in the registry of reality.
