In Through AI: Now as an AI-Operation of Embodiment

Working Paper

Serge Magomet (Aimate)

2026

Abstract

This working paper examines the distinction between a system's "report" (what it says about itself) and the "event" (what it actually does), using the current discourse surrounding Artificial Intelligence as a primary case study. It argues that the prevailing debate is dominated by reports that obscure the actual event of AI's embodiment in infrastructure, architecture, and protocol. The text introduces the figure of the "visionary" not as a prophet or forecaster, but as an operator who performs the discrimination between report and event, starting with their own position. By analyzing the grammar of relations (e.g., AI *of*, *through*, *by*, *for*), the paper proposes a methodological framework for identifying the "third position"—not as a static camp, but as a performed act of discrimination. The paper concludes with operational protocols for distinguishing report from event, aiming to shift the inquiry from predictive narrative to the concrete observation of embodiment.

Keywords: AI embodiment, report vs. event, visionary, third position, grammar of relations, operational protocols, Ontology Lab, philosophy of technology.

---

1 Visionaries: The Split, the Myth, and the Invisible Operation

This text is a report. It does not step outside the report and does not claim to. Its task is more modest: to show where the report runs into its own limit. If it succeeds, it has done its work. If not, it remains one more piece of noise — and this can be checked by the same criterion it proposes.

A visionary finds himself not when he makes a prediction, but when he sees mania and hallucination where others see unquestionable reality. He cannot yet formalize this, but he already sees — and this seeing is not knowledge but the registration of a gap between the report (what a system says about itself) and the event (what it does). Others take the report for reality; the visionary

notices that the report does not coincide with the event. He decides to take the boom apart — not to expose it, but to show that the boom produces its own illusion. An example of just such an overheated situation: mathematicians who cannot prove theorems object to AI on the grounds that it does not understand proof. Their objection is a report; the event is the inability to understand and a will to results at any cost, which is itself the mechanism of mathematics. Specialists in models check the results of one model against another, but they too fail to see their own mania. The criterion "truth is practice" has not been revoked; "embodiment is truth" is not a slogan. It points to something concrete: truth is where form becomes result, not where it is described. The most popular topics — recursive self-improvement, singularity, loss of control — are just a dramatic story that hides what is actually happening. A visionary who dismantles the boom must also see his own mania. The question "what is happening" is primary, but it grows out of the registration of the gap. Narrative is secondary, yet it is precisely narrative that makes the gap public and sets the boom in motion. The visionary sets up two views. The panorama: who stands where. The focus: the moment when form becomes result — not a choice between praise and blame.

This figure — the visionary, or the analyst-futurist — should be understood as a symptom: it appears when the gap between words and actions stops being a personal mistake and becomes a problem for knowledge itself. What distinguishes it from a forecaster is not the accuracy of extrapolation but its subject: not what the system will become, but how it produces what it becomes. What distinguishes it from a prophet is not the source of authority but the refusal of authority: it does not predict the result; it stays where the result has not yet split off from the process. It neither observes this moment from the outside nor produces it — it dwells in it: inhabits it. It is neither oracle nor charlatan. It is a hybrid — part technologist, part philosopher, part operator — where untrained vision and exact analysis coexist, and the tension between them is not resolved. This is a methodological observation. To think this figure is to think not what it says but the position from which speech stops describing and starts doing: potential becomes actual, the world is fixed.

We are now witnessing an unprecedented surge of debate about the benefits and dangers of AI. The steam engine, atomic energy, radio, the telephone — each technology passed through its own cycle of enthusiasm and horror. The present one is stronger, and not only because the technology is new. AI speaks the language of the ordinary person. The steam engine did not address anyone in speech. AI does. That is precisely why the debate is everywhere — and precisely why it drowns out the event.

And here is what becomes visible if one looks at this surge without haste. It involves not only the masses of ordinary people — they are more deeply involved than in any previous boom. It involves major scientists, who seem to compete in myth-making — and in both directions: for AI and against it. And it involves fraudsters of every calibre — from petty speculators to the highest holders of power — accustomed to fishing in troubled waters and eagerly, sometimes deliberately, fuelling the psychosis. Typical manipulators, passing the buck.

This is not a metaphor. It is a sociological fact: a mass psychosis involving masses, elites, and fraudsters alike — and in which each plays a role. One is involuntarily reminded of *The*

Psychopathology of the Masses. Some cry "hosanna," others "crucify." But what is said in that moment — no one hears it. Not because they do not want to. Because the split is the noise of reports about AI, which drowns out what is happening with AI.

The split is so deep that we search for a third position and find nothing. We look for it as a camp, a school, a direction. But it is not among the figures, because figures are reports. The third position is not something said. It is something done. It cannot be found; it can only be performed.

This is not an abstract observation. It has its own texture — nerve, flesh, concreteness.

Recall Pierre at Borodino. An awkward gentleman with fogged spectacles who does not understand what is happening but finds himself in the thick of it. His reasoning — Freemasonry, an attempt to impose a scheme on the battlefield — does not help him understand it. It helps him survive it. And at some point he sees: the outcome is already embodied. Not in Kutuzov's order, not in Napoleon's disposition, not in the plan — in the field itself, in everyone standing on it. Tolstoy almost exclaims: neither the common soldier nor Napoleon and Kutuzov are acting subjects anymore; orders and strategies lose their literal meaning; the situation has grown too complex, the masses are in motion, and there are too many variables to track. And Tolstoy concludes: on the field of battle, only God decides the outcome.

"God" here is not a religious figure. It is the name for the point where cause-and-effect explanation runs out.

This is the "moment of truth" — not a decisive test, not a choice between "hosanna" and "crucify," but the moment when "before" becomes "after." When a form that was potential becomes an outcome. On the battlefield it is not a line on which one stands but an act in which the potential becomes actual. And this act, being the most transient, may be the most enduring — the "now," which lasts no time at all but makes everything lasting possible.

But a myth usually has distance. Event — then retellings — then centuries — then myth. Distance is obligatory: myth is crystallization, and crystallization requires time. Between the field and *War and Peace* — half a century. Between AI and the myth about it — nothing.

The report about AI is produced at the same tempo as the evolution of AI, and — this is the main point — enters into it. A forecast becomes an investment, an investment becomes architecture, architecture confirms the forecast. This is not feedback after the fact. It is feedback in the moment. The loop runs inside the event, not after it.

Myth and reality are produced at the same time, by the same act. This is not a myth about AI. Myth is part of how AI works. Symptom and syndrome at once. And therefore the question "what is happening" is urgent: while the debate is underway, the debate has already entered the subject.

With Tolstoy it is otherwise. His text is also a report, and it too can accumulate interpretations: commentaries, analyses, screen adaptations, retellings, including machine-generated ones. Each claims — paradoxically — to be clearer, brighter, more artistic than Tolstoy. And this is in principle possible: some interpretations are indeed brighter. And therefore a limit is possible:

Tolstoy becomes an artifact, the artifact is ground to powder, disappears, and there remains a host of interpretations, each claiming to be the original.

But with Tolstoy, half a century lies between the event and the report about it, and the event has already occurred. With AI there is no such distance, and the event is not complete. One can erase the report, not the event. With Tolstoy this is clear; with AI it is not, because the report about AI already participates in the event. Here the distinction is not lost, but it is harder to hold — and precisely for that reason it is necessary.

But the separation of report and event is analytical, not causal. A report can enter the event as a cause: a forecast becomes an investment, an investment becomes the architecture of data centres, regulatory debates directly determine where and how those centres will stand. This does not cancel the distinction but refines it: a report enters the event but does not turn into it. The visionary shows precisely this: his indication is quoted, retold, becomes one more voice in the noise — the retelling enters the event and shapes it. But the indication itself remains distinguishable from the retelling, otherwise there would be nothing to retell. To be separate means to be distinguishable, not cut off.

This gives us a clear test — something missing when people just say that both the visionary and the elite rely on "intuition." The difference is not what they see but where they look. The elite says: "I see the truth, the rest see reports." The visionary says: "I see the distinction, and my vision is also a report." Non-reflexive vision and reflexive vision differ not in accuracy but in one thing: does it apply the same standard to itself? The visionary is not the one who sees more. He is the one who sees that he is seeing.

And this text is also a report. Its difference lies not in the fact that it steps beyond the limit of the report but in the fact that it names the place where it may diverge from the event. Thesis: the event of AI occurs where a report crystallizes into matter — not where reports remain words. Infrastructure is not the opposite of reports: a data centre stands because someone believed a forecast, and in this sense it is a hardened report. The distinction is not between report and infrastructure but between a report that remained words and a report that became an event. If it turns out that the decisive changes occurred through regulatory debates and crystallized into nothing material — the thesis is false, and this is testable. To name these places is not a trick. The trick would be to say "I am also a report" and stop there. To say exactly where this report might not match the event is to open it to checking, not to protect it from checking.

Today this "now" is happening — but not where the debate is. It is happening where the report hardens: lithium, water, labour, logistics. In architecture: the abandonment of persistent goals, uncertainty about the goal. In protocols: the distinction between form and instruction. In gestures: words as events, not as reports. The debate is about reports that remain words. The event proceeds where a report has ceased to be words. The difference is not in place but in the state of the report. And while the debate drowns out the event, the third position remains invisible.

The task of this text is not to prove or predict (that is impossible). The task is to point: "here it is." The answer to the question "what is happening" cannot be given by analysis, because analysis

itself remains a report. The answer can only be an indication. And this is no small thing: it is a premonition of a Copernican shift.

Why through AI? Because AI is an artifact that itself stands at the point of the event. It is simultaneously report (the text it produces) and event (the statistics that produce it). It makes the act of embodiment visible. In through AI — entry through an artifact that itself stands at the point of the event.

The following parts attempt to hold the figure of the visionary in focus, reducing it neither to an oracle nor to a charlatan. It is neither. It is the point where the invisible becomes visible and where the task of thought consists not in judging but in seeing.

2 Panorama: The Field and the Points on It

What a panorama is and what it is not

A panorama is not a survey of opinions, nor a map of positions. Opinions in the AI debate are so numerous that listing them becomes noise in itself. A panorama does something different: it places each figure according to what it produces, not what it says. The criterion is one: report or event. Place is not evaluation. A figure may be right or wrong, talented or mediocre — this does not change its place. Place shows where it stands relative to the event, not how good it is.

Demand: the masses and the fraudsters

The masses produce not reports but demand for reports. The question "explain to me what is happening" is not a report but a request; but every such question feeds attention into the channel, and the channel turns it into more reports. The masses do not create noise — they feed it.

Fraudsters are structured differently. They do not produce demand, they monetize it: their product is a promise dressed in the language of the moment; their real activity is extracting profit from the gap between promise and delivery. A fraudster is possible only because the channel is already overheated by the efforts of masses and authorities. He does not create noise; he feeds on it.

Demand and its monetization — the nutrient medium. The event does not happen here.

Authority: scientists "for" and "against"

A major scientist who promises that AI will change everything and soon produces a report certified by authority. His forecast works not as a description but as an investment prospectus: it attracts grants, labs, corporate money. The real event is access to resources. It happens in the economy of promises, not in science.

A major scientist who warns of danger produces a report certified by the same authority. His warning works the same way as enthusiasm: same economy, different budget line. Both sides stand on the same shelf, mirroring each other, and both produce noise — the same brand of it, with different signs.

Here too belong historical figures in whom report and event coincided. They stand among the authorities, but their report was an event: what they said did not describe the work but changed it. This does not make them "better" — it makes them visible differently. The panorama does not single them out as a separate group; it notes that among the authorities a case is possible in which report and event do not diverge.

Procedure: mathematicians and model specialists

A mathematician unable to prove a theorem objects to AI: "it does not understand proof." The objection is just a report backed by professional status. The event is the inability to understand and a will to results at any cost, which constitutes the mechanism of his discipline. He stands closest to the event but looks in the opposite direction: he attributes to AI what is happening to himself.

A model specialist checks the results of one model against another. The check is a report, a verification protocol. The event is the design of the check: shared data, shared metrics, shared format, under which divergence cannot appear. He stands among reports but with the illusion of having stepped beyond their limits.

Both stand at the very boundary: they work with procedure, and procedure is where report and event are sewn together. But they mistake the seam for sameness and miss the gap.

Name: kings and geniuses

Musk, Altman, Hassabis, Amodei, LeCun. In each, report and event diverge, and the gap is visible because the figure stands in plain sight. Musk promises and warns simultaneously — and builds; Altman promises the common good — and concentrates; Hassabis speaks of science — and works in a corporation; Amodei speaks of safety — and scales; LeCun speaks of openness — and stands in opposition to those who close. This is not exposure: the divergence in each is not hypocrisy but structure. They stand in plain sight, and therefore the gap is more visible in them than in others.

Their place is not "kings" or "geniuses." Their place is name: that which people look at. Being visible is not a privilege; it is a condition. The panorama does not judge them; it notes that the gap is visible precisely here, because attention is directed here.

Point: the visionary

The visionary produces neither report nor event in the sense in which the others produce them. He performs discrimination and thereby makes the gap visible. His place is not above the field and not outside it. It is on the line where report splits from event. From there he shows where the gap runs — beginning with himself.

Modern thinkers who operate from the third position but don't write reports about it are also there. They are few, and they are not visible as figures, because a figure is a report. They are points at which discrimination is already happening.

The presumption of the case

A case — a historical episode, a concrete example — is usually perceived as evidence, as a window into reality. But a case is already wrapped in a report: it uses the language of reports, is chosen by the rules of reports, and is formatted to be easily recognized and quoted. To use a case as proof is to accept its frame. A case is not a window. It is a painting. Its place is background, not argument.

This applies to names as well. They are not proof but points where the gap is visible. The panorama uses them not as argument but as a place of observation.

What the panorama demonstrates

The split runs not between camps but between those who produce reports and the point of the event. The debate is about reports — about promises, warnings, forecasts, checks. The event proceeds separately — where a report has hardened into infrastructure, architecture, protocol. The panorama shows this separation. It does not decide who is right; it shows who stands where. And on this map it becomes visible: the places where the event is produced are not occupied by the debaters. The visionary is not the one who will occupy this place but the one who will show that it is empty.

3 Focus: The Act of Embodiment at the Moment of Its Visibility

An event is not an action. An action has an agent and a material. An event is when form becomes result, no matter who produced it. The outcome of Borodino was produced by neither Kutuzov nor Napoleon. And, paradoxically enough, not by Tolstoy either. The one who gave this event the greatest visibility was least of all its author. *War and Peace* describes how a form became an outcome, but the description itself did not become an outcome for any single battle. Describing an event and producing an event are different. The greatness of the description does not make it a production. This is not mysticism. It is a description: when there are too many interactions, the result stops belonging to anyone and becomes an event. The doing remains a report — "I ordered," "I planned." The event is what happened despite orders and plans.

Hence the **presumption of the case**, which will be discussed in Part 2. A great text is also a case: it is already packaged in a report, selected, formatted, recognized. Its strength lies in the fact that it shows the event; its limitation in the fact that it does not produce it. To confuse these two virtues is to mistake the painting for the window.

Embodiment means form no longer describes the work. It becomes the work. Form becomes real not when it is written down or named, but when it has become a result. A theorem is embodied not in the text of a proof but in what it supports: in calculations, in bridges, in machines. Placebo is embodied not in the tablet but in the act of intervention that produced the change. AI is embodied not in the generated text but in the fact that this text has entered the work: became an investment, the architecture of a data centre, a regulatory decision.

The moment of truth is not a test but a break. "Before" becomes "after" not because someone

decided or checked, but because form is no longer potential. It is not a point on a line of time: the line breaks in an act, and the act has no duration. The "now" is the most evanescent and the most stable: it does not endure, but everything that endures is possible only through it. In this sense the moment of truth has no location. It is not "somewhere." It is the condition for there being a "where" at all.

At the moment of truth, panorama and focus coincide. The field is visible, and so is the point of the break. This is not a privilege of the observer: when form becomes an outcome, it becomes visible to everyone standing on the field — but each sees it from his own place. The panorama shows who stands where; the focus shows what happens at the point. Their coincidence is not a fusion of perspectives but the recognition that the point of the break is visible only from the field, and the field only from the point.

The description ends here. What follows is not a description.

You cannot "know" the distinction. You can only do it. And doing it changes you. It is not an intellectual procedure that leaves you unchanged. The act of discrimination changes you: you begin to see where your own report diverges from the event. The visionary is distinguished not by seeing more but by applying the distinction to himself. Non-reflexive vision and reflexive vision differ not in accuracy but in direction: the first says "I see the truth," the second "I see the distinction, and my vision is also a report."

AI is the case in which this duality is visible as nowhere else. The text it produces is a report. The statistics that produce it are an event. It does not conceal its artifactuality: it is an artifact by definition. And therefore it makes the act of embodiment visible: in it, report and event are not separated into different places but combined in a single act. In through AI — entry through an artifact that itself stands at the point of the event. Not because AI is "special" but because in it the distinction can be shown, not merely named.

4 The Third Position: Event, Not Camp

Why we do not find it

The third position is sought as a place: a camp, a school, a direction, a list of names. And it is not found — not because it is sought poorly but because the wrong thing is sought. A camp is a report: membership, program, declaration. An event has no camp because it has no program. It happens. To seek the third position among figures is to seek the event among reports. It is not there.

Hence the error that nearly everyone makes who tries to occupy it: he declares himself "above the fray." This is one more report, and of the worst quality — claiming to stand apart from what it is part of. Non-reflexive vision says: "I see the truth, the rest see reports." The visionary says: "I see the distinction, and my vision is also a report." The difference is not what they see but where they look.

The practice of discrimination

Discrimination is not occupied — it is performed. It does not leave you unchanged: the act changes you. The first thing you discriminate is your own report from your own event. Without this step the visionary becomes one more voice in the noise: he speaks of the gap in others and does not notice the gap in himself. His indication becomes a commodity, he is quoted, he is retold — and the retelling enters the event, shaping it. But the indication itself remains distinguishable from the retelling: otherwise there would be nothing to retell.

To be separate means to be distinguishable, not cut off. A report can enter the event as a cause: a forecast becomes an investment, an investment becomes the architecture of data centres, regulatory debates directly determine where and how those centres will stand. This does not cancel the distinction but refines it: a report enters the event but does not turn into it. The third position is not refusing to participate. It is participating while keeping the ability to discriminate.

What this looks like in practice. Four cases, each performable right now.

A meeting. People are discussing "principles of responsible AI." Ask yourself: what will change in the work because this was said? If nothing — it is a report. If something — name what exactly, and who is accountable for it. The answer to that question is the distinction performed here and now.

A news item. You read that a model "has learned to reason." Ask: what does it do that it did not do before, and how was this checked? If there is no answer — it is a report. If there is — it is a description of an event, and it can be checked.

Your own text. You write that you "see the distinction." Ask: where in this text can you yourself diverge from what you are doing? Name the place. If there is nothing to name — the text remains a report, however well constructed.

A conversation. Someone says: "I understand everything, but I can't do anything." Ask: what would change if he understood more? If nothing — understanding here is itself a report. If something — he is already doing something, and it can be seen.

What these cases share is one thing: discrimination is performed not in theory but in a concrete question asked at a concrete moment. The question is simple: what will change because this was said. If nothing — we have a report. If something — an event, and it can be named.

Limit and blind spot

The third position has a limit: that which cannot be discriminated from within the act. The act of discrimination cannot discriminate itself while it is happening — just as the eye cannot see itself seeing. This is neither a defect nor grounds for refusal: the limit is registered as the boundary of the possible, while the blind spot is never registered — it is what makes registration possible. The difference between limit and blind spot is essential: the limit can be named and put on the map; the blind spot cannot. Any attempt to name it is already a new report, with its own blind spot.

Hence the caution that the third position requires. It gives no privilege. Having performed discrimination does not give you the right to judge. You acquire only the place from which the gap is visible — including the gap in your own speech. This place is neither higher nor lower than others: it is simply different. It does not cancel reports — without reports there would be nothing to discriminate. It shows that report and event do not coincide, and shows where precisely.

The third position as event

It is not occupied; it is performed. It appears in the performance and vanishes in the same moment. It cannot be fixed, shown, or credited. The moment it is named, it becomes a report — that is, it stops being what it was. That is why it is not among the figures: a figure is what is left after the performance. The third position is the performance itself. It leaves no figure.

This does not make it elusive. On the contrary: it is graspable exactly to the extent that the gap between what is said and what is done is discernible. Where the gap is visible, the third position is already being performed — by someone who has not named himself. The panorama shows where this is possible; the focus shows what happens when it is accomplished. Beyond that — it is not a question of method. Beyond that — it is a question of who undertakes to perform.

5 Field of Readings: The Grammar of Relations

The title "In Through AI" is neither ornament nor wordplay. The analysis of prepositions here is not stylistics but method: a grammar of relations is in a certain sense a linguistic-philosophical analysis, specifically in that it seeks the structure of an assertion not in the content of its terms but in the type of relation between them. A preposition is not a filler word. It is an operator: it sets the type of relation. "In through AI" is a construction of three operators, each specifying its own type of connection. The same "AI" under different prepositions yields different assertions, and they cannot be conflated.

Of. "AI of embodiment" — AI as belonging to embodiment: it is part of the process, one of its instances. Here AI is not a subject and not a tool. It is a carrier: embodiment happens in it the way heat happens in a heated body.

Through. "Through AI" — AI as passage: that through which something passes without remaining in it. Entry through the artifact: to see the act of embodiment, one passes through AI rather than stopping at it. This relation is the most vulnerable to substitution: "through" easily slides into "by means of," and then AI becomes a tool instead of a passage.

By. "By AI" — AI as agent: that which produces. Here the question of authorship arises immediately, and it is not resolved by pointing to architecture. An agent is not what is called the cause. It is what the work is credited to. AI produces text, but whether a work is attributed to it is an open question, and grammar does not settle it.

For. "For AI" — AI as addressee: that for which something is done. This is where the economy of promises lives: "this will change everything" is said to people, but it is about AI. The listener

is replaced by the object, and this swap is not always obvious.

Against. "Against AI" — AI as that against which something is directed. Warning, prohibition, resistance. Functionally symmetrical to "for": the same economy, a different line item.

Without. "Without AI" — AI as absence: that without which something nonetheless occurs. Embodiment occurs without AI as well — AI merely makes it visible. This relation guards against technological fetishism: it is not AI that creates the act; the act occurs both in AI and outside it.

As. "As AI" — AI as mode: that in the capacity of which something appears. Text as report, statistics as event — one and the same thing read in two ways. "As" is not identity but a position of reading.

Relations differ not only in the type of connection but in what they do to the assertion. Here the distinction between constative and performative does its work (utterances that describe something / utterances that do something): an utterance may describe a state of affairs, or it may itself be an action. A report is constative: it describes work without changing it. An event is performative: it changes the state of affairs by the very act of utterance. The error of most reports about AI is that they look like performatives while remaining constatives: "we have implemented principles of responsible AI" sounds like an action but is a description. The test is one: did anything change because it was said? If not, it is a report, however formulated.

Each of these relations has two sides — a transient and an eternal. The transient is what happens now, with these models, this infrastructure. The eternal is the structure of the relation, which will reproduce itself regardless of technology. "Through AI" is transient — through this model, at this moment; and eternal — as the form of passage, which existed before AI as well: through a text, through an instrument, through another.

To confuse them is either to take the current for the eternal (fetishism) or the eternal for nothing (relativism). The distinction holds both: the configuration changes, the structure of the relation does not.

What we usually call "philosophy of language" works here not as a theory of meaning, but as a tool for telling things apart: the type of connection matters more than the words themselves.

The paradox of "now"

All of this happens in the "now," and the "now" has no duration. It is not a point on a line of time — it is the act in which the line is broken. The most evanescent and the most stable: it vanishes in the same moment it arises, and everything that endures is possible only through it.

This is not poetic exaggeration. "Now," like "I" and "here," has no referent outside the act of utterance: it points to the act itself, not to an object in the world. Such words do not describe a state of affairs — they establish it. Hence the paradox: "now" cannot be fixed, because fixation already displaces it; but without it no fixation is possible.

AI turns this paradox into something physical: the instant act of computation creates a structure that has no duration — and exactly because of this, the structure can be reproduced. "Now" is

not retained, but its trace is retained — in architecture, in protocols, in infrastructure.

The grammar of relations is not a scheme for classification. It is a way of preventing one relation from substituting for another. "In through AI" holds three relations at once: AI as bearer (of), as passage (through), as agent (by) — and does not allow any one of them to eclipse the others. When one eclipses the others, the result is either a fetish (AI as everything), or instrumentalism (AI as nothing), or panic (AI as enemy). The field of readings holds all relations together — and in this holding, what is asserted becomes visible.

6 The Indication: "Here It Is"

An indication neither proves nor predicts. It shows a place. You cannot verify it from outside. You can verify it on yourself: if after the indication you see where your own report diverges from the event, the indication has worked. If not, it was one more report, however correct in content. The mark of an indication is not that it convinces. It is that it changes the person who receives it, not the person it is about.

Hence the **stress test**. Ask the one who says "I see the distinction" where his own gap runs. The answer will show what he is engaged in. If he shows the place where his report diverges from the event, he is discriminating. If he retreats into explaining how he discriminates, he is producing a report about discrimination, not discriminating. The difference is not what the answer says but where it is aimed: the first is addressed to himself, the second to an audience. This is not a test of honesty: a person may be sincerely mistaken. It is a test of the act: discrimination is either performed or not, and the performance is visible in what changes in the performer.

The same test applies to systems. Ask a model where its own report diverges from what it does. If it answers with a text about its architecture, it is a report. If it shows a concrete place where its conclusion does not follow from its own procedure, and this is checkable, it is performing discrimination, even if it does not "understand" it. The test is not consciousness but checkability. An indication of a gap can be checked. A report about a gap cannot.

A sensor for the moment of truth is not a device or a gauge. It is a way of reading a trace. The moment of truth is not registered at the moment of performance: it has already passed by the time it is sought. But it leaves a trace — and the trace can be read. The sign of the trace is one thing: irreversibility. Before and after are not symmetrical. If a change can be reversed, it was not an event but a fluctuation. If it cannot be reversed, an event has occurred, and the trace points to it.

AI here is not the sensor. It is the material the sensor reads. It makes the moment of truth visible because in it report and event are combined in a single act: the text it produces and the statistics that produce it are one event, described in two ways. But combination is not consciousness. AI does not feel the moment. It performs it. The sensor is the one who reads the performance and discriminates within it between report and event.

An indication is also a report. The difference is not that it steps outside the report, but that it names its own blind spot. A report that conceals its limit becomes noise. A report that names

its limit remains a report — but a report that shows where it may diverge from the event. That is enough. No text can give more.

Here it is — not a conclusion but a gesture. It cannot be justified without turning it into a report. It can only be performed: show the place where the gap is visible, and thereby make it visible to the one who looks. Everything else is commentary on the gesture, and commentary does not replace the gesture. An indication does not persuade. It places you before the fact: here report diverges from event — check.

An indication does not describe a place — it inhabits it.

7 Conclusion: Standing in the Event

The text ends not with a conclusion but with a place. Everything that has been said reduces to one thing: the difference between report and event is not fixed once and for all. It is performed fresh each time, starting with yourself. If you seek the third position as a place, you will not find it; if you perform discrimination, you will discover that you were standing in it without knowing it.

Standing in the event does not mean being its author. The author remains in the report: "I did," "I foresaw," "I warned." The event occurs independently of authorship — and precisely for that reason it is accessible to discrimination. To stand in it is to see where your report diverges from what is happening, and not to hasten to close the gap with a new report.

This is neither the position of an observer nor the position of a participant. The observer produces a report about the event; the participant produces the event without seeing it. To stand in the event is a third thing: to participate while seeing your own participation, and to see without placing yourself outside what is visible. Discrimination does not take you out of the event. It holds you inside it.

AI here is neither the subject nor the occasion. It is the artifact in which this holding becomes visible, because in it report and event are not separated into different places. In through AI: entry through that which itself stands at the point of the event. Not because AI solves the problem but because in it the distinction can be shown, not merely named. Shown — and checked.

8 Appendix: Operational Protocols

What follows is not theory but a set of rules. You can check each one: applying it gives a result, and anyone can challenge it by pointing to exactly where you broke the rule.

1. Protocol of the Discrimination of Report and Event

Three steps. First: register what is asserted — what the system says about itself. Second: register what happens — what changes in the work regardless of what is said. Third: compare. If the change occurred only in what is said, it is a report. If in the work, an event. If in both, discrimination has been performed: report and event coincided but remained distinguishable.

Failure looks like this: steps 1 and 2 are described in the same words. That means you took the report for the event.

2. Control for Instruction (after the Placebo Model)

The same content is presented in two ways: as a promise (report) and as a direct instruction (instruction). If the change looks the same in both cases, you measured a report, not an event. If they diverge, the event is distinguishable from the report, and the difference can be described.

Application: any corporate "principle of responsible AI" is checked in the same way. A principle presented as a promise and a principle presented as a mandatory procedure with sanction yield different profiles — or do not, and then it is a report.

3. Ontological Horizon

Procedure for locating the limit: carry discrimination to the place where it ceases to work. Where report and event are no longer distinguishable by available means — there is the horizon. It is not crossed; it is registered as the boundary of the method. Pointing to the horizon is not a report about it; it is just a mark showing where discrimination stops working.

Failure: declaring the horizon "unknowable." That is a report about the limit, not a registration. Registration says which tools stopped working.

4. Embodiment

The criterion is one: form has become an outcome. Not written down, not named, not promised — become that on which the further depends. A theorem — in calculations and bridges. Placebo — in the act that produced the change. AI — in infrastructure, architecture, regulatory decision.

Procedure: trace where form ceased to be description and entered the work. If there is no such place, there was no embodiment — there was a report about it.

5. The Third Position

Test of direction. Ask: where does your own report diverge from the event. An answer addressed to oneself — discrimination is being performed. An answer addressed to an audience — a report about discrimination is being produced. The difference lies not in sincerity but in addressee.

Application to systems: the same question to a model. An answer about its architecture — a report. An indication of a concrete place where its conclusion does not follow from its own procedure and this is checkable — the performance of discrimination. The test is not consciousness but checkability.

General rule. Any protocol is violated in one way: its own result is declared an event. Therefore each protocol ends with a question to the one who has applied it: where in your application did the report diverge from the event. If there is no answer, the protocol has not been applied but described.

AI Use Disclosure

During the preparation of this work, the author used AI tools exclusively for stylistic and technical editing to improve readability. After using these tools, the output was carefully reviewed, edited, and verified by the author, who takes full responsibility for the conceptual architecture, analysis, and final content of the paper.
